CANADIAN TECHNICAL BULLETIN 010

TARGET MARKET ROOFING

September 8, 2020 / FOR IMMEDIATE RELEASE

Subject : Vapour Retarder SA 31 Temporary Roof Exposure Reduced to Two Months.

Vapour Retarder SA 31 is often used to serve as temporary roof protection in areas limited to light construction traffic prior to the installation of the primary roofing system. We are finding that it is difficult to control construction traffic leading to excessive damage of the membrane. In addition, prolonged exposure during the hot weather months may compromise the effectiveness of the membrane as temporary roof protection. Therefore, the maximum exposure time for Vapour Retarder SA 31 has been reduced from three (3) months to two (2) months.

Vapour Retarder SA 106 is a robust option for temporary roof protection and can be left exposed for up to six (6) months.

Please contact Sika Sarnafil Canada Roofing Technical Department for further information.
